

Wellcome Genome Campus | OC3_1-17_Data_input_on_Galaxy

Hi. Here will be learning to import data onto Galaxy. Type usegalaxy.org.au on your browser. The Galaxy server will open. You have to log in or register. Put your username and password and log in to upload, process, and download the data.

Here, to upload the data, you'll find the Upload Data option on the left panel. Click on choose file from local folder. And select all the files. Once it is loaded, click on Start. On the status bar the percentage of uploading is visible.

Once all the samples are uploaded, it turns green, which can be visualised in the History panel. Next, we have to create data set list. For that, click on Operations on multiple dataset option. There, we have to select all the samples.

And on the For all selected menu option, on the dropdown, click on Build Dataset List. When the window opens, give any name of your choice. I have given Nanopore_Runs. And Create Collection. Thank you.
